Fixed it by running this command to install chromium manually.

```
node node_modules/puppeteer/install.js
```

Why is "puppeteer-core" a dependency even though you don't use it in the code? Specifically `chromium.puppeteer.launch()` instead of `puppeteer.launch()` – Nermin May 3 at 18:06

I tried these exact dependency versions and got but got **WARNING:** `crash_report_exception_handler.cc(240)]` `UniversalExceptionRaise: (os/kern) failure (5)` – Nermin

sure you have puppeteer specifically

ve-dev

[chrome-aws-lambda/wiki/HOWTO:-](#)
[nd](#)

on puppeteer for local
core for production deployments.

answered Jul 19, 2021 at 6:08

I copy pasted the npm install instruction in that README but got an error: `Could not resolve dependency: npm ERR! peer puppeteer-core@"^10.1.0" from chrome-aws-lambda@10.1.0`
– Nermin May 3 at 18:16

I had the same issue. What worked for me was to specify as the `executablePath` Puppeteer launch option the fullpath to the local chromium used by Puppeteer.

Something like this:

```
const launchOptions = {
  // other options (headless, args, etc)
  executablePath: '/home/jack/repos/my-repo/node_modules/p
}
```

As noted in [another answer](#), it seems that also referencing a chromium local binary would work, but I think it's a worse solution, since Puppeteer is [guaranteed to work only with the local bundled version of Chromium](#).

In my case, I don't want full puppeteer. It just couldn't find the browser on my machine where it is then it worked. Thank you!

...es that it helps someone not ... I did.

...er that used Puppeteer, and I'm ... TS to JS. In the build step, ... everything into one file, but I had

I did this by marking `puppeteer` as external. [See docs here](#).

Since `npm i` downloads a compatible version of chromium to the `node_modules` folder, once I preserved this import, it was able to find Chromium in the `node_modules` folder.

My build file looks like:

```
require("esbuild").buildSync({
  entryPoints: ["src/index.ts"],
  outdir: "build",
  bundle: true,
  platform: "node",
  target: "node16",
  external: ["puppeteer"],
});
```

And I run it with `node prod-build.js`.

Now in my code, I can just call launch!

```
const browser = await puppeteer.launch()
```

You may need to install some dependencies depending on your OS. Check Puppeteer's [Troubleshooting](#) page for more details.

I was having this error too and I noticed that I started getting such an error after updating my node from my Dockerfile to version ^16 (my puppeteer is in a container). How did I solve it? I downgraded my node from Dockerfile to version 12. Hope this resolves it...

puppeteer-core using

node node_modules/puppeteer/install.js

For this setup to work you will have to add `chrome-aws-lambda` in the `devDependencies`.

```
"devDependencies": {
  "chrome-aws-lambda": "^10.1.0"
}
```

Also before you take it to production don't forget to add the layer in your `template.yaml` file:

```
Layers:
- !Sub 'arn:aws:lambda:ap-south-1:764866452798:layer:
```

include `chromium`. (chromium is a
browser)

package

or just simple add `executablePath` if you don't want to install chromium (I assume you have Chrome browser in your system)

```
const CHROME_EXECUTABLE_PATH = "/Applications/Google Chrom
const browser = await puppeteer.launch({
  executablePath: CHROME_EXECUTABLE_PATH,
  headless: true
});
```

to get the path, open your browser, type `chrome://version/`
